

Predicting Ski Jumps using State-Space Model

Živa Hegler and Neca Camlek

JSI

October 5, 2025

Outline

- Introduction
- Modeling Framework and Dataset
 - State-space models and Least squares method
 - Data processing
- Methodology
 - Different approaches and error function
 - Animation app
- Main Results
- Discussion and Conclusion

Motivation

- ▶ Planning of ski jump enlargement and anticipating risky conditions
- ▶ Goal: Predict ski jumps based on external factors

Figure: Flying hill in Planica

- ▶ State-space models (SSM)
- ▶ Least squares method (LS)

Figure: Schema of SSM

Customized caption

Figure: My first figure in beamer.

Data Description

- ▶ Data structure
- ▶ Angles
- ▶ coordinate system on a main ski jumping hill in Planica

Angles

Figure: Representation of different measured angles.

Ski jumping hill

Figure: Ski jumping hill with a coordinate system placed on top.

Different approaches and error function

- ▶ pure SSM
- ▶ SSM + PINN (Physics Informed Neural Networks)

Application

- Description of the application
- Observing measured and predicted jumps

Ski jump animation

Figure: Adjusted sliders in the app

Main Findings

Key Result

Your important result goes here.

Customized caption

Actual vs Simulated Trajectory
Error: 1.689, Simulated length: 198.7, Actual length: 201.9

Figure: My first figure in beamer.

Interpretation

- ▶ Limitations
- ▶ Future work and potential improvements
- ▶ Short recap

Thank you!
